Product Description

Abstract:

Automatic Night Light Control System is a simple yet powerful concept, which uses IC 555 timer. By using this system manual works are 100% removed. It automatically switches ON lights when the sunlight goes below the visible region of our eyes. This is done by a sensor called Light Dependent Resistor (LDR) which senses the light actually like our eyes. It automatically switches OFF lights whenever the sunlight comes, visible to our eyes. By using this system energy consumption is also reduced because nowadays the manually operated Night lights are not switched off even the sunlight comes and also switched on earlier before sunset. In this project, no need of manual operation like ON time and OFF time setting.

Introduction

Night light controllers are smarter versions of the mechanical or electronic timers previously used for Night light ON-OFF operation. They come with energy conservation options like twilight saving, staggering or dimming. Also many Night light controllers come with an astronomical clock for a particular location or a Global Positioning System (GPS) connection to give the best ON-OFF time and energy saving. Automatic Night Light Control System is a simple and powerful concept, which uses IC 555 timer to switch ON and OFF the Night light automatically. By using this system manual works are removed. It automatically switches ON lights when the sunlight goes below the visible region of our eyes. It automatically switches OFF lights under illumination by sunlight. This is done by a sensor called Light Dependent Resistor (LDR) which senses the light actually like our eyes. By using this system energy consumption is also reduced because now-a-days the manually operated Night lights are not switched off properly even the sunlight comes and also not switched on earlier before sunset. In sunny and rainy days, ON time and OFF time differ significantly which is one of the major disadvantage of using timer circuits or

manual. This project exploits the working of an IC 555 timer to switch ON and switch OFF the lights at appropriate time with the help of an electromagnetically operated switch. A Night light, lamppost, Night lamp, light standard, or lamp standard is a raised source of light on the edge of a road or walkway, which is turned on or lit at a certain time every night. Modern lamps may also have light-sensitive photocells to turn them on at dusk, off at dawn, or activate automatically in dark weather. In older lighting this function would have been performed with the aid of a solar dial. It is not uncommon for Night lights to be on poles which have wires strung between them, or mounted on utility poles. Automatic Night light needs no manual operation of switching ON and OFF. The system itself detects whether there is need for light or not. When darkness rises to a certain value

Product Description

INTRODUCTION:

In today's world, there is a continuous need for automatic appliances. With the increase in standard of living, there is a sense of urgency for developing circuits that would ease the complexity of life. Many times we need to monitor the people visiting some place like shopping mall. To provide solution for this I am going to implement a project called "Bi Directional Digital Visitor Counter" with automatic room light control. This project has a "Visitor counter". Basic concept behind this project is to measure and display the number of persons entering in any room like seminar hall, conference room etc. LCD displays number of person inside the room. We can use this project to count and display the number of visitors entering inside any conference room or seminar hall. This works in a two way. That means counter will be

incremented if person enters the room and will be decremented if a person leaves the room. In addition, it will automatically control room lights. When the room is empty the lights will be automatically turn off. Digital Visitor Counter bidirectional visitor counter In today's world, there is continuous need automatic appliance will be increase in standard of living, there is a sense of urgency for developing circuit that would ease the complexity of life. Also if someone wants to know the number of persons present in a room so as not to have congestion, the circuit proves to be helpful. The theme of this project when merged with certain established technologies can be quite effective in number of countries like Germany, France & Japan etc. This Project is useful in developing countries and this project has a bright future. This project helps us to control the light of a room automatically and counts the number of persons/visitors entering and leaving the room. By using this circuit and proper power supply we can implement various applications such as fans, tube lights, etc.

APPLICATIONS:

- **Offices and Commercial Spaces:** The system can be implemented in offices and commercial spaces to optimize energy consumption and enhance convenience.
 - **Educational Institutions:** Schools, colleges, and universities can benefit from this system to effectively manage room lighting based on occupancy.
 - **Hospitals:** Automatic room light control can be valuable in hospitals and medical facilities, improving energy efficiency and reducing manual intervention.
 - **Residential Buildings:** Home automation systems can incorporate this project to automate room lighting based on the number of occupants.
-

Product Description

INTRODUCTION:

The Automatic Room Light Controller with Bidirectional Visitor Counter with Multiple Load using Arduino Uno is a project aimed at automating the control of room lighting based on the number of people present in the room. This system utilizes Arduino Uno, an IR module, an LCD display, and multiple 5V relays to detect and count the number of visitors entering or exiting a room. It provides a flexible solution for controlling multiple loads, allowing for efficient energy management and enhanced convenience.

AIM:

The main objective of this project is to develop an automated room light controller with bidirectional visitor counting capability that can control multiple loads. The aim is to achieve energy efficiency, convenience, and versatility in managing room lighting based on the occupancy level.

PRINCIPLE:

The system operates on the principle of using an IR module to detect the presence of people. The IR module emits infrared radiation and senses its reflection from nearby objects. When a person enters or exits the room, the module detects the change in reflection and triggers the count accordingly. The Arduino Uno processes this information and updates the visitor count displayed on the LCD display. Additionally, multiple 5V relays are used to control individual loads based on the visitor count.

ADVANTAGES:

- **Energy Efficiency:** The automatic control of room lights ensures that the lights are only turned on when necessary, resulting in energy savings.
- **Convenience:** The system eliminates the need for manual control of room lights, providing a hands-free and automated approach.
- **Accurate Visitor Count:** The bidirectional visitor counter ensures an accurate count of incoming and outgoing visitors for better monitoring and management.
- **Cost-effective:** The project utilizes cost-effective components, making it a cost-efficient solution for room light control and visitor counting.

APPLICATIONS:

- **Offices and Commercial Spaces:** The system can be implemented in offices and commercial spaces to optimize energy consumption and enhance convenience.
 - **Educational Institutions:** Schools, colleges, and universities can benefit from this system to effectively manage room lighting based on occupancy.
 - **Hospitals:** Automatic room light control can be valuable in hospitals and medical facilities, improving energy efficiency and reducing manual intervention.
 - **Residential Buildings:** Home automation systems can incorporate this project to automate room lighting based on the number of occupants.

Product Description

INTRODUCTION:

The aim of this project is to design and implement an automatic street light system using the IC555 timer, Light Dependent Resistor (LDR), and a 4V LED strip. The project utilizes the IC555 timer as a control unit to detect the ambient light level using the LDR and automatically switch the LED strip on or off accordingly. This system offers an energy-efficient and convenient solution for street lighting, ensuring that the lights are turned on only when it is dark.

WHY WE NEED AUTOMATIC STREET LIGHT CONTROLLER?

The need for an automatic street light system using IC555 arises due to several reasons:

1. **Energy Efficiency:** Traditional street light systems often operate on a fixed schedule or rely on manual switching, resulting in unnecessary energy consumption during daylight or low-traffic periods. An automatic street light system using IC555 and an LDR ensures that the lights are turned on only when ambient light levels are low, effectively saving energy.
2. **Cost Reduction:** By minimizing energy wastage, the automatic street light system helps reduce electricity bills and operating costs for street lighting. The use of low-voltage LED strips further contributes to cost savings due to their energy-efficient nature.
3. **Convenience and Safety:** Manual control of street lights can be inconvenient and impractical, especially in larger areas or during unexpected changes in daylight conditions. The automatic system eliminates the need for manual intervention, ensuring that the lights are always appropriately illuminated during dark hours. This enhances safety for pedestrians and drivers, reducing the risk of accidents or criminal activities.
4. **Environmentally Friendly:** With a focus on energy conservation, the automatic street light system aligns with sustainable practices and environmental considerations. By reducing unnecessary energy consumption, it helps lower carbon footprint and contributes to a greener and more eco-friendly urban infrastructure.
5. **Scalability and Adaptability:** The IC555-based automatic street light system can be easily scaled and adapted to various urban, suburban, and rural environments. It can be

integrated into existing infrastructure without major modifications, making it a flexible solution for different lighting requirements.

6. **Maintenance Efficiency:** Traditional street light systems often require regular manual inspections to identify faulty or non-functioning lights. With the automatic system, the lights are monitored and controlled automatically, allowing for proactive maintenance and reducing the need for frequent manual checks.

In summary, the automatic street light system using IC555 offers energy efficiency, cost reduction, convenience, safety, environmental benefits, scalability, and maintenance efficiency. It addresses the shortcomings of traditional street lighting methods and provides an intelligent and automated solution for effective and efficient illumination of public spaces.
